- MSc. Eng. Abdallah Mohammed
   Office: C3.208, Email: <u>abdallah.abdelrahman@guc.edu.eg</u>

#### Course Policies

- You have to attend the lab session only with your group.
- Validation reports will be submitted <u>only during your lab</u> <u>session</u>.
- It is not allowed to negotiate your grades with the your TA. So, check the office hours if you need any support or help before the deadline.
- Taking attendance and entering the lab will not be allowed 10 mins after the starting of Labs.
- You will be informed with any other policies based on your attitude during this semester.

#### **Tutorial Contents**

- Introduction to Embedded Systems
- Introduction to Micro Controllers
  - ATmega328P
- Introduction to Microchip Studio
- Lab 1 Validation

#### **Tutorial Contents**

- Introduction to Embedded Systems
- Introduction to Micro Controllers
  - ATmega328P
- Introduction to Microchip Studio
- Lab 1 Validation

#### **Introduction to Embedded Systems**

- An embedded system is a computer system that has a dedicated function within a larger mechanical or electrical system. It is a combination of a computer processor, computer memory and input-output peripheral devices.
- An embedded system interacts with the environment and typically controls the physical operations of the machine that it is embedded within; thus, it often has <u>real-time computing constraints</u>.
- Some design issues of real-time embedded systems:
  - Selection of hardware and software.
  - Understanding the <u>programming languages</u> used and their <u>real-time</u> <u>implications</u> resulting from their translation into <u>machine code</u>.
  - Maximizing fault tolerance and reliability of performance.

#### **Introduction to Embedded Systems**

- Hardware usually used in embedded systems:
  - Microcontrollers (MCU)
  - Microprocessor (MPU)
  - ➤ Field Programmable Gate Array (FPGA)
  - Application Specific Integrated Circuit (ASIC)
- Difference between a microcontroller and a microprocessor:
  - Microprocessor is an Integrated Circuit (IC) which has only the CPU inside them. It doesn't have RAM, ROM, and other peripheral on the chip.
  - Microcontroller has a CPU, in addition with a fixed amount of RAM, ROM and other peripherals all embedded on a single chip. It is like a mini computer on a single chip.
- Modern embedded systems are often based on microcontrollers.
- Microcontrollers examples: PIC, AVR, ARM, ... etc.
- We will use AVR microcontrollers in this course.

#### **Tutorial Contents**

- Introduction to Embedded Systems
- Introduction to Micro Controllers
  - ATmega328P
- Introduction to Microchip Studio

#### ATmega328P (AVR Microcontroller)

From the datasheet:

http://ww1.microchip.com/downloads/en/DeviceDoc/Atmel-7810-Automotive-Microcontrollers-ATmega328P Datasheet.pdf

- High performance, low power AVR® 8-bit microcontroller
- Advanced RISC architecture
  - 131 powerful instructions most single clock cycle execution
  - 32 × 8 general purpose working registers
- Peripheral features
  - Two 8-bit Timer/Counters with separate prescaler and compare mode
  - One 16-bit Timer/Counter with separate prescaler, compare mode, and capture mode
  - Real time counter with separate oscillator
  - Six PWM channels
  - 8-channel 10-bit ADC in TQFP and QFN/MLF package
    - Temperature measurement
  - Programmable serial USART
  - Master/slave SPI serial interface
  - Byte-oriented 2-wire serial interface (Phillips I<sup>2</sup>C compatible)
  - Programmable watchdog timer with separate on-chip oscillator
  - On-chip analog comparator
  - Interrupt and wake-up on pin change

- I/O and packages
  - 23 programmable I/O lines
- Operating voltage:
  - 2.7V to 5.5V for ATmega328P

ATmega328P can be programmed using:

Arduino Framework

Closer to machine level

Higher level and easier to program

Prof. Ayman A. El-Badawy Department of Mechatronics Engineering Faculty of Engineering and Material Science

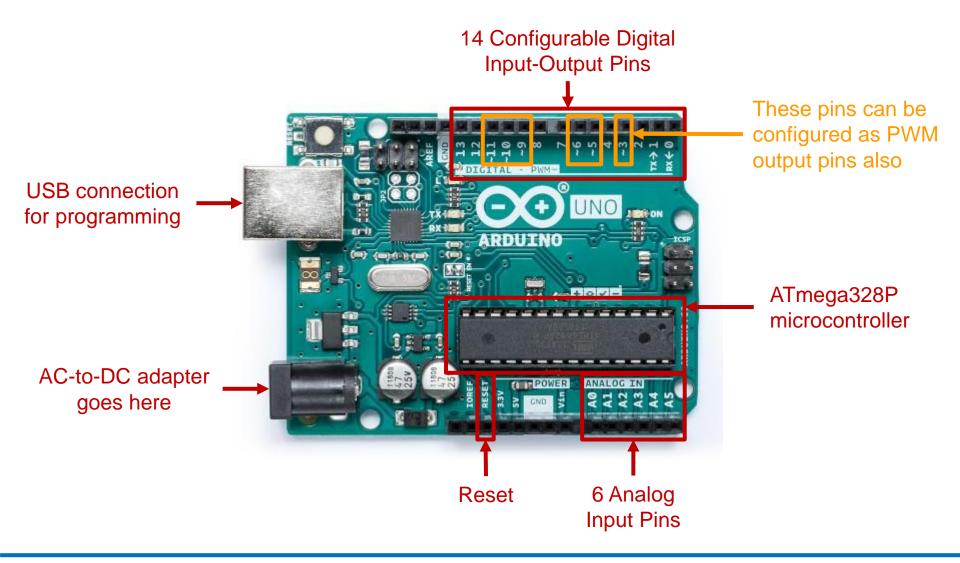

#### Example of using Atmega328P as a Microcontroller (Arduino)

- Arduino is a microcontroller board based on the ATmega328P.
- It has 14 digital input/output pins (of which 6 can be used as PWM outputs), 6 analog inputs, a 16 MHz quartz crystal, a USB connection, a power jack, an ICSP header and a reset button.
- It contains everything needed to support the microcontroller; simply connect it to a computer with a USB cable or power it with a AC-to-DC adapter or battery to get started.

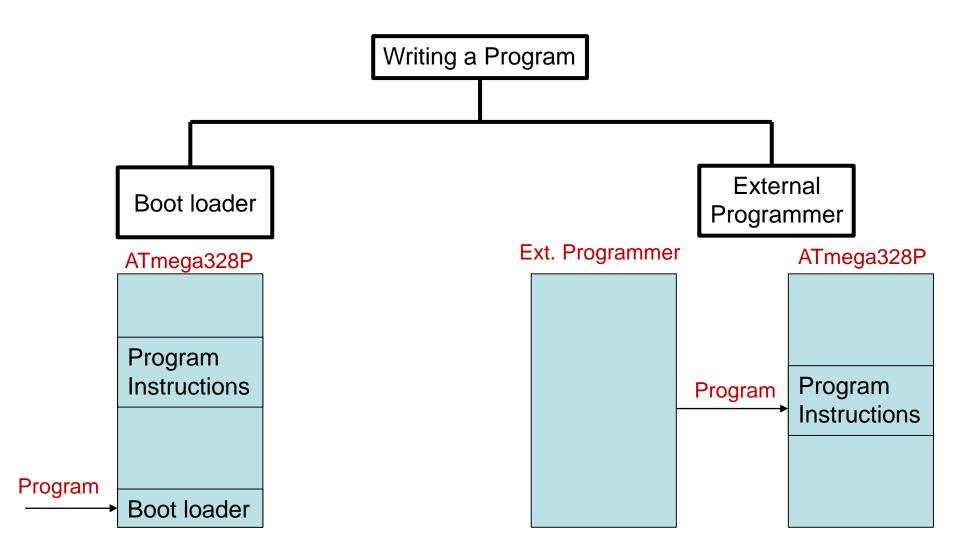

#### **Arduino Uno**

#### **Tutorial Contents**

- Introduction to Embedded Systems
- Introduction to Micro Controllers
  - ATmega328P
- Introduction to Microchip Studio

#### **Microchip Studio Installation**

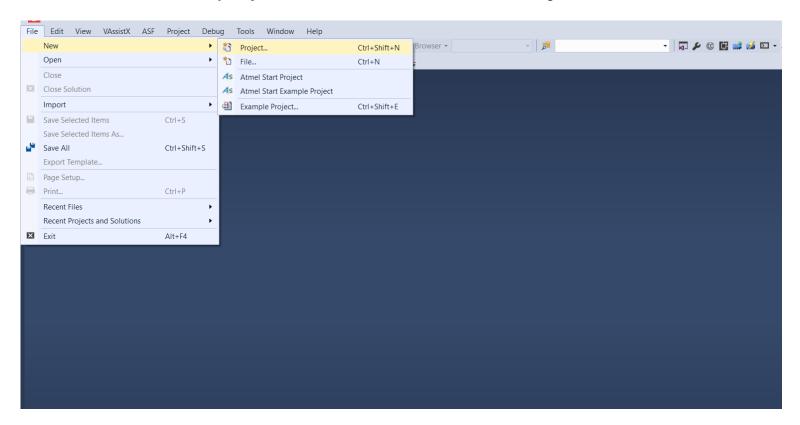

- Microchip studio is the integrated development platform (IDP) for developing and debugging all AVR® and SAM microcontroller applications.
- Microchip Studio Download Link:

https://www.microchip.com/en-us/development-tools-tools-and-software/microchip-studio-for-avr-and-sam-devices

#### **Creating a New Project in Microchip Studio**

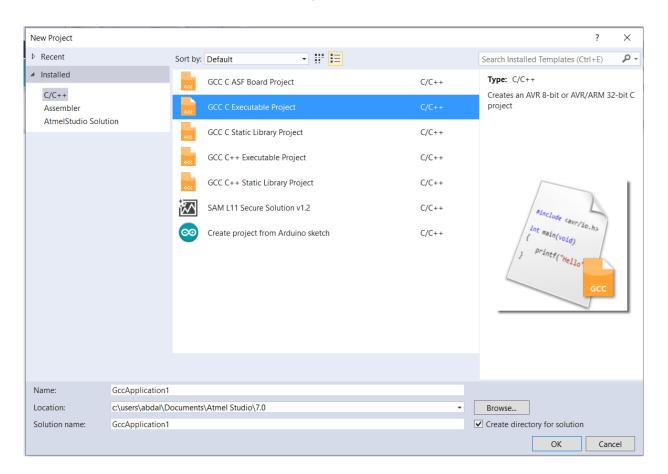

To create a new project, click on File>New>Project

#### **Creating a New Project in Atmel Studio 7**

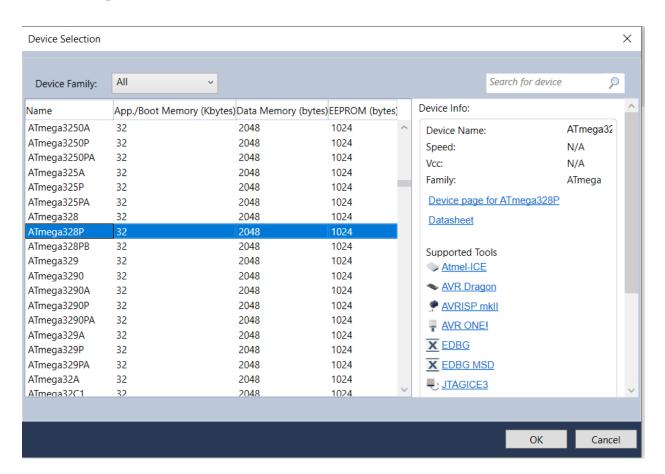

Choose GCC C Executable Project

#### **Creating a New Project in Atmel Studio 7**

Select ATmega328P from the list of devices:

#### **Build Project**

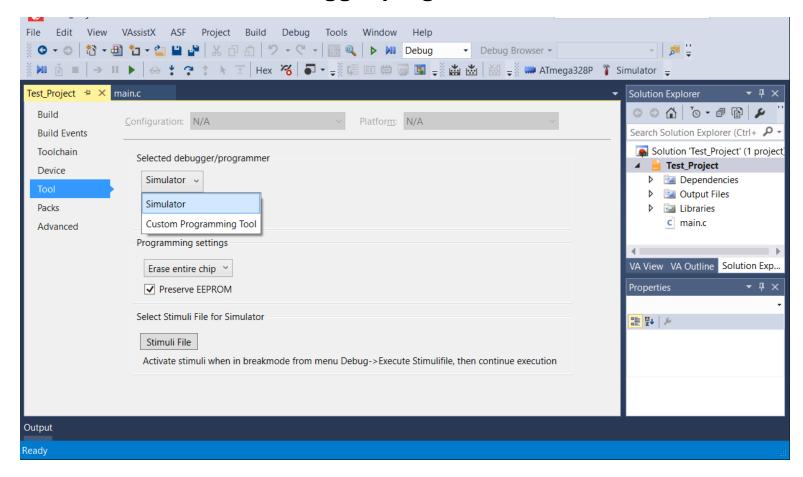

Write your code in main.c

```
<u>P</u>roject
                            <u>B</u>uild
                                  <u>D</u>ebug
 O → O | * → □ * → □ * → □ Debug
                                                           ▼ Debug Browser ▼
main.c ⊅ ×
Test_Project
                     → C:\Users\abdal\Documents\Atmel Studio\7.0\Test_Project\Test_Project\main.c
main.c
   #include <avr/io.h>
  ∃int main()
      DDRB = 0b00000011;
      PORTB = 0b00000010;
      int i,j;
      while (1)
         for(i=100;i>0;i--)
            for(j=100;j>0;j--);
         PORTB^=0b00000011;
```

#### **Select Debug Tool**

- Click on Project > [Project name] Properties
- From Tool tab, Select debugger/programmer to be Simulator

#### **Build Project**

Click on Build> Build Solution

```

 To watch how variables change during the debugging session, click on Debug>Windows>Watch>Watch 1

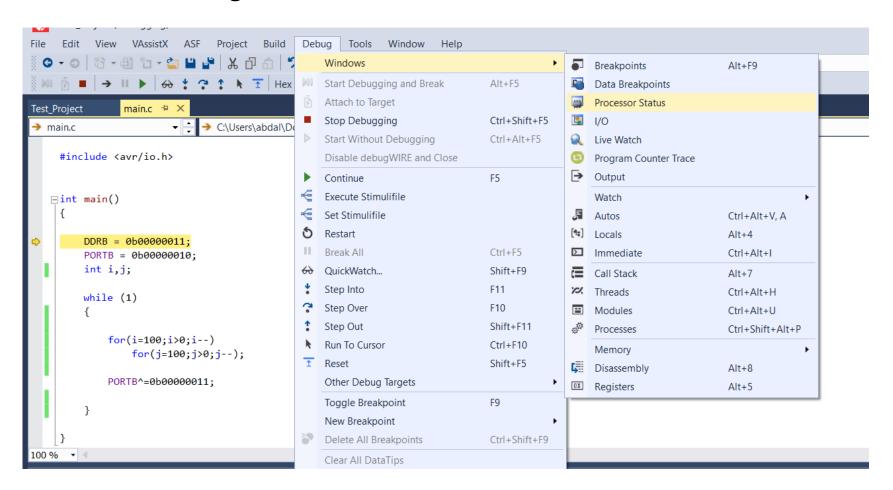

- In the watch window, type the name of the variable you want to watch during debugging then press enter to add it to the list.
- In this example the variables of interest are: PORTB, DDRB, i and j

Watch 1		
Name	Value	Туре
PORTB	0	int{data}@0x0025
DDRB	0	int{data}@0x0024
🥝 i	Optimized away	Error
🤪 j	Optimized away	Error
Autos Locals Watch 1		

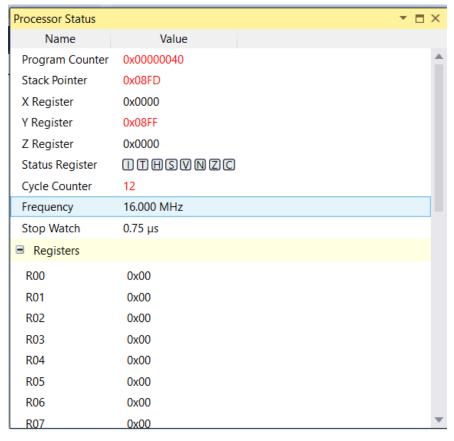

Click on Debug>Windows>Processor Status

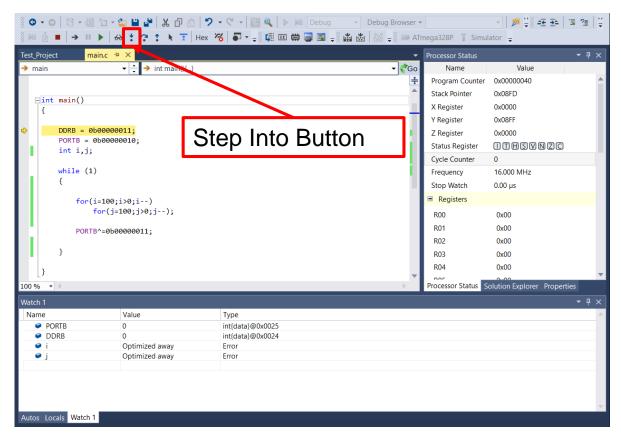

- Set processor clock frequency. In this case it is 16 MHz
- The Cycle Counter is the number of instruction cycles elapsed since the start of the simulation and the Stop Watch shows the time elapsed since the start of the simulation.

- Click on Step Into button to execute a single step in the simulation
- Watch how variables change as the program executes
- To execute the code until it reaches a certain line right click on the line and click on Run to Cursor

#### To be prepared for the next week lab:

- Purchase the components shown in the components list pdf on the CMS
- Solder the components to build the AVR embedded
- Download the following softwares:
  - Zadig: from <a href="https://zadig.akeo.ie/">https://zadig.akeo.ie/</a>, tested version is v2.5
  - Avrdude: from <a href="http://download.savannah.gnu.org/releases/avrdude/">http://download.savannah.gnu.org/releases/avrdude/</a>.
     Tested version is v6.3
- Bring your laptop !!!
